# bOS 4-process system (win64)

USER INPUT is a small window containing the command line.
Every input is sent directly to CORE.

CORE runs in B:\sys. It process every command sent by Uinput,
and tell Uinterface what to display.

USER INTERFACE runs in B:\sys where BatBox is present. It shows
the result of each command to the user and can display ASCII/8-bit
graphics.

WATCH DOG is a hidden process that checks the integrity of every process.
If CORE is stopped, WD clean the system and close all apps.
